

Image 1

Prompt:

Describe the disease of the image

YOLO:

Not used

Gemini:

The image shows severe dental caries (tooth decay) in a young child's primary molars. The decay is extensive and dark-colored, indicating significant damage to the tooth structure. The molars show extensive discoloration and possibly cavities that have progressed into the dentin and potentially even the pulp (nerve) of the teeth. This requires immediate dental intervention to prevent further damage, infection, and potential pain.
